                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MetGluAlaLeuGluLeuMetGlyValGlnPheValAspAlaLeuIleLysLysGlyGln 69
                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                  isolated nucleic acid detection reagent for detecting 1000 or more

The invention relates to an isolated NOVX polypeptide. A therapeutic, i.e. the NOVX polypeptide, nucleic acid and antibody, is useful for manufacturing a medicament for treating a syndrome associated with a human disease, e.g. a NOVX-associated disorder. The NOVX polypeptides can be used as immunogens or as vaccines. The NOVX polypeptide, nucleic acid or antibody is useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g. cancer, diabetes, Alzheimer's disease, Parkinson's disease, Huntingron's disease, asthma, allergies, emphysema, bronchitis, autoimmune disease, graft-versus-host disease, arthritis, scleroderma, systemic lupus erythematosus, bacterial infections, cystic fibrosis, coronary artery disease, stroke, hypertension, myocardial infarction, haemophilia, idiopathic thrombocytopenic purpura, hyperlipidaemia, obesity, cirrhosis, inflammatory bowel disease, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New NOVX polypeptides and nucleic acid molecules, useful for diagnosing, preventing or treating NOVX-associated disorders e.g. cancer, diabetes, Alzheimer's disease, stroke, arthritis, hypertension or myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Shimkets RA, Patturajan M, Vernet CAM, Casman SJ, Malyankar UM; Shenoy SG, Spytek KA, Gangolli EA, Miller CE, Boldog FL, Li L; Taupier RJ, Kekuda R, Smithson G, Zerhusen BD, Liu X, Colman SD. ပ္ပ	kidney disease. The NOVX polypeptides and nucleic acid molecules are	
႘	useful for determining the presence of or predisposition to a disease	
ខ	associated with altered levels of the NOVX polypeptide or the nucleic	
ខ	acid molecule, or for screening for molecules that inhibit or enhance	
ပ္ပ	NOVX activity or function. The nucleic acids may be used as hybridisation	
ပ္ပ	probes, in chromosome mapping, tissue typing, preventive medicine, or	
ပ္ပ	pharmacogenomics. The present sequence represents cDNA encoding a human	
ပ္ပ	NOVX protein.	

Sequence 7396 BP; 1878 A; 2016 C; 2290 G; 1212 T; 0 U; 0 Other;

The invention provides the primary nucleotide sequence of the WSBV genome (AAH6289), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG84010-AAG85051) and oligonucleotide sequences (AAAH62840-63160) suitable for use as primers or probes. The nucleic amoltocules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp. (Updated on 06-AUG-2003 to correct os field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG8910-AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp. These can be used in the treatment of diseases such as cancers, Hodgkin's disease, Von Hippel-Lindau syndrome, Alzheimer's disease, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia telangiectasia, leukodystrophies, addiction, anxiety, depression, pain,
                                                                                                                                                                                                     Human; NOVX; single nucleotide polymorphism; SNP; anti-HIV; cytostati antizatretiosoclerotic; antidabatic; antiathmatic; antidiflammatory; hammostatic; hypotensive; neuroprotective; anorectic; nootropic; antidepressant; immunosuppressive; antibacterial; antiparasitic; virucide; tranquilizer; anticonvulsant; osteopathic; analgesic; antibarkinsonian; dermatological; antinfertility; cerebroprotective; antidadictive; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAM, Casman SJ, Malyankar U;

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromesome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein esquences have applications in the polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and produces dependent on DNA and coding sequences of the invention. Note: The sequence data for this coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4106 GGCTTCTCAGCCAGTCCGACCAGCAAGTCCAGCAAGCTCACCAAGGACTTCTCCGCGCTGG 4165

The present invention describes a method for identifying a compound that modulates angiogenesis or tumourigenesis. The method comprises: (a) contacting the compound with angiogenesis. The method comprises: (a) contacting the compound with angiogenesis. Dayspeptide. e.g. Ax1, tubulin cofeactor D, transglutaminase 2, cytosine deaminase, peptidase Mai, tubulin cofeactor D, transglutaminase 2, cytosine deaminase, gas6, SRm160, non-method myosin heavy chain, calmodulin 2, novel symptotice, novel compound upon the angiogenesis polypeptide or the compound upon the angiogenesis polypeptide or the physical effect of the compound upon the target polypeptide or its fragment or inactive variant; and (c) determining the chemical or phenotypic effect of the compound upon a cell comprising the target polypeptide or its fragment or inactive variant, thus identifying a compound that modulates cell cycle arrest. Also described is a method of compound that modulates cell cycle arrest. Also described is a method of modulating angiogenesis in a subject. The angiogenesis or tumourigenesis compound that modulates, and can be used in antibody, antisense and RNA interference (RNAi) therapies. The method is antibody, antisense and RNA interference (RNAi) therapies. The method is antibody, antisense and RNA interference (RNAi) therapies. The method is angiogenesis, cancer, stroke, infertility and heart disease. The present compounds or compound that modulates angiogenesis. The method is angiogenesis, cancer, stroke, infertility and heart disease. The present compounds in the avenulation or method is angiogenesis. The method is angiogenesis, cancer, stroke, infertility and heart disease. The present is supplement in the expending and present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4272
                              The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80102) that exhibit activity elating to cytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, issue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4383
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |||||||

vention relates to a recombinant DNA construct comprising an open g frame placed under the control of a non-native promoter. The open g frame comprises bp 2389-2826 of the Yershina peetic plasmid representing the pesticin immunity protein, a bacteriocin. Also seed are the sequences of the Yershina plasmids pCD1 (responsible complex virulence response termed LCR, low calcium response) and encoding capsular proteins and a murine toxin). The recombinant DNA uct is useful for preparing a composition for diagnosing, treating venting infection caused by Yershina pestis (e.g. bubonic plague).
                                                                                                                                                                                                                                                                                   combinant DNA construct comprising an open reading frame placed the control of a non-native promoter, useful for preparing a tion for diagnosing, treating or preventing infection caused by la pestis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       e 100990 BP; 26256 A; 24506 C; 26153 G; 24075 T; 0 U; 0 Other;

The invention relates to a novel isolated NOVX polypeptide comprising: a sequence of 57-1149 amino acids as defined in the specification, or its mature form; a sequence that is at least 95% identical to the 57-1149 amino acid polypeptide; or a sequence comprising one or more conservative amino acid polypeptide; or a sequence comprising one or more conservative substitutions in the 57-1149 amino acid polypeptide. The NOVX proteins of the invention include the following protein families: FADD interacting protein-like, ATPase, H+ Transporting, Lysosomal (vacuolar Proton Pump) - 11ke, FGF 17-11ke, Single Pass Transmembrane-like, Beta-Kactoaryl Synthase 11ke, Neuralin 2-11ke, RhoGAP-like, Phospholipase-Activating Protein-like, ChR-Methyltransferase-like, RhoGAP-like, Phospholipase-Activating Protein-like, EnkS-like, Savenger Receptor Domain Containing Protein-like, Metallothionein IA-like, Subunit-like, Teceptor Domain Containing Protein-like, Phenylalanine and Frotein-like, Phospholipase-Like, NoGO Tetratrico Peptide Repeat Protein-like, Immunoglobulin Domain Containing Protein-like, Phenylalanine and Histidine Ammonia-Lyase-like, Callular Retinaldehyde-Binding-like, Glutamine Repeat Containing Protein-like, The Receptor Associated Factor2-like, Vacuolar Protein Scriing Homologue R-VPS33A, Bola Domain Containing Protein-like, Armadillo/Beta-Catenin-like, Metalloprotease-like, T10 Ser/Thr-rich-like, Armadillo/Beta-Catenin-like, Protein-like, Armadillo/Beta-Catenin-like, Protein-like, Armadillo/Beta-Catenin-like, NoVX polypeptide is used in gene therapy or a vaccine. The NoVX protein of the invention composition for treating or preventing cancer. This polymucleotide sequence represents a gene cocine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New NOVX polypeptide, useful for preparing a composition for treating or preventing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Taupier RJ, Zerhusen BD;

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ121119-ABZ1206) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The concoded polypeptides (ABP68902-ABP68849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellinaging, screening and diagnostic assays and for treating cellinaging, screening and diagnostic assays (multiple sclerosis, or Alzheimer's disease), autonommune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, wound, burns, incision, ulcers, liver platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthitis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        748

                                                                       The invention relates to an isolated polynucleotide. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of the arginine-rich protein-like polypeptides, such as cancer and inflammation. They can also be used in forensics, gene mapping, identification of mutations responsible for genetic disorders, and in assessing biodiversity. The present sequence represents a novel human arginine-rich protein cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ----GAGGAGAACTTTAGGCGGCTCCAAGCCGAG 1069

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABGR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 83
                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/16-ABL/30511), expressed DNA sequences (ABL/16-ABL/175) and the encoded proteins (ABB5/777-ABB72072). The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   50 MetGluAlaLeuGluLeuMetGlyValGlnPheValAspAlaLeuIleLysLysGlyGln
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -----AAAGGCAAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GluValLeuGlu------LysValHis 88
                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from brosophila. The invention iseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABR2702). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LeuPro-----LeuAlaProSerMetGluAlaLeuGluLeuMetGlyValGlnPheVal

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
